

# Shooting Raw Workshop Topics

- What is Raw?
- Why would you want to shoot Raw?
- What do you do with a Raw data file?
- What is a DNG file and the DNG converter?
- What is a Histogram (From George's Digital Image Processing workshop)
- Adobe CR3 Camera Raw Control Panel Icons vs. Elements 6 or 7
- What can ACR do and How?
  - The Photoshop Elements version of ACR interface
  - Basic And Detail Panels
  - Toolbar
  - White Balance correction
  - Tonal correction
  - Sharpening Controls
  - Noise Controls
  - Multiple Image Raw Processing
- Raw limitations
- Some things to try and references
- Discussion and Questions

# What Is Raw?

- In the process of taking a picture
  - The sensor measures light.
  - The camera's computer/processor converts measured light on the sensor into digital values (Raw data).
  - Not shooting Raw? The digital values (Raw data) are processed into a picture, usually a JPEG File which is stored on a memory card. The recorded digital values (Raw data) are then discarded.
  - Shooting Raw? Set camera to record Raw. The digital values (Raw data) are recorded and stored as data (Raw File) on the camera's memory card. Some cameras will create the RAW data plus a converted JPEG file.

# Why would you want to shoot Raw?

- More data to manipulate if needed and gives more options for correcting a shot
- Can make the equivalent pre-shot JPEG settings after the shot without any data loss
  - Such as White balance, Contrast, Hue, Saturation, Sharpening
- Can correct exposure, to a limited extent
- Bottom-line it's capable of fixing mistakes and making corrections to a photo that wouldn't be possible with a JPEG photo.

# Question

What do you do with a Raw Data file?

# Answer

Convert the Raw file to Picture (jpeg, tiff, or psd file)  
using Raw Processing Software

## Examples of Raw processing Software

- Adobe Camera Raw (versions available in Photoshop CS3/CS4, Elements, & Lightroom)
- Proprietary software (comes with camera)
  - Probably gives best automatic/default conversion because its designed for specific Raw data generated by your camera and can usually run in batch mode
  - Some proprietary software isn't too good
  - Its free
  - Only works for one type of Raw file
- Other
  - SILKYPIX, Bibble, DXO, Raw Shooter, Etc.

# What can Adobe Camera Raw (ACR) do in general?

- Makes the Raw data file into a picture file such as JPEGs (8 bit), Tiff or PSD (8 or 16 bit)
- Can modify and correct problems before converting the Raw file to picture (in a non-destructive process)
- When a JPEG, PSD or TIFF is created from a RAW file further processing/photo editing can be done.
  - You have the choice of working with either a 16-bit or 8-bit picture file for Photoshop editing
  - If only Shooting JPEG you would only have the 8-bit file choice

# To DNG or not to DNG?

DNG (digital negative) = Adobe's RAW file format  
(usually generated from your camera's Raw files)

## ■ Advantages

- Adobe's version of Raw file is DNG, a converter a standalone application can convert each camera's proprietary format to a standard archival Raw DNG format
- XMP/sidecar files unnecessary
- The DNG converter can be downloaded at <http://www.adobe.com/products/dng/>, it's free
- It's an open format that allows third-party support (some cameras can shot DNG, no conversion required)

## ■ Disadvantages

- Probably not readable by proprietary software and therefore inconvenient
- The DNG with-raw-embedded-file size will be larger than if you used a proprietary Raw
- Requires an additional step

1 Select the images to convert

C:\Documents and Settings\John...Pictures\2009 Pentax\20090430\  
 Include images contained within subfolders

2 Select location to save converted images

C:\Documents and Settings\John...Pictures\2009 Pentax\20090430\  
 Preserve subfolders

3 Select name for converted images

Name example: MyDocument.dng  
Document Name  +  +  
 +   
Begin numbering:   
File extension:

4 Preferences

Compatibility: Camera Raw 5.4 and later  
JPEG Preview: Medium Size  
Don't embed original

# DNG Converter

## Preferences

Compatibility

Compatibility:

The DNG file will be readable by Camera Raw 5.4 (Photoshop CS4) and later, and Lightroom 2.4 and later. The DNG file will often be readable by earlier versions, depending on the camera model.

Preview

JPEG Preview:

Original Raw File

Embed Original Raw File

Embeds the entire non-DNG raw file inside the DNG file. This creates a larger DNG file, but it allows the original raw file to be extracted later if needed.

# What is a Histogram?

- Lexical Definition:

- A bar chart (or graph) representing a frequency distribution; the heights of the bars represent observed frequencies or the number of items counted and the bars, themselves, represent different items.

- Photoshop Definition:

- A chart that graphically represents the relative distribution of the various tones that make up a digital image. Tones typically range from 0 (completely dark/black) to 255 (completely light/white).

# Of What Value is a Histogram?

- Histograms are **ESSENTIAL** for understanding:
  - the current characteristics of an image
  - image strong/weak points
    - over/underexposure
    - contrast
    - color tone/gamut
  - the before/after effects of a correction/filter

# Histogram Display Palette

## PHOTOSHOP

*Window -> Histogram*

## PHOTOSHOP ELEMENTS

*Window -> Histogram*

*Refresh Icon*

# Histogram Characteristics

- A Histogram is:
  - Viewable as a composite (RGB) or viewable by channel
  - Displayed as dark-to-light left-to-right
  - Indicative of under/overexposure via ramping on left/right end of graph
  - Indicative of contrast via tonal width\*\*
  - Indicative of banding and image loss
  - A representation of the currently viewable image

\*\* The eye is most sensitive to middle tone values.

# Histogram Characteristics

- A Histogram is **NOT**:
  - Directly associated with specific image pixels\*
  - Does not have a “correct” graph shape\*\*

\* Except in unusual cases where large areas of an image have a constant tonality.

\*\* Although certain generalizations may be applicable (discussed later)

# How do you process camera raw files?

## *Basic Panel*

- Open Raw file with Elements Editor, (Photoshop CS3/CS4 or Bridge)
  - Check bit depth (16 or 8) 16 is preferred (this will be discussed later)
  - Check Resolution (pixel per inch, no resample)
- White balance controls
  - Temperature (blue/yellow color balance)
  - Tint (green/magenta color

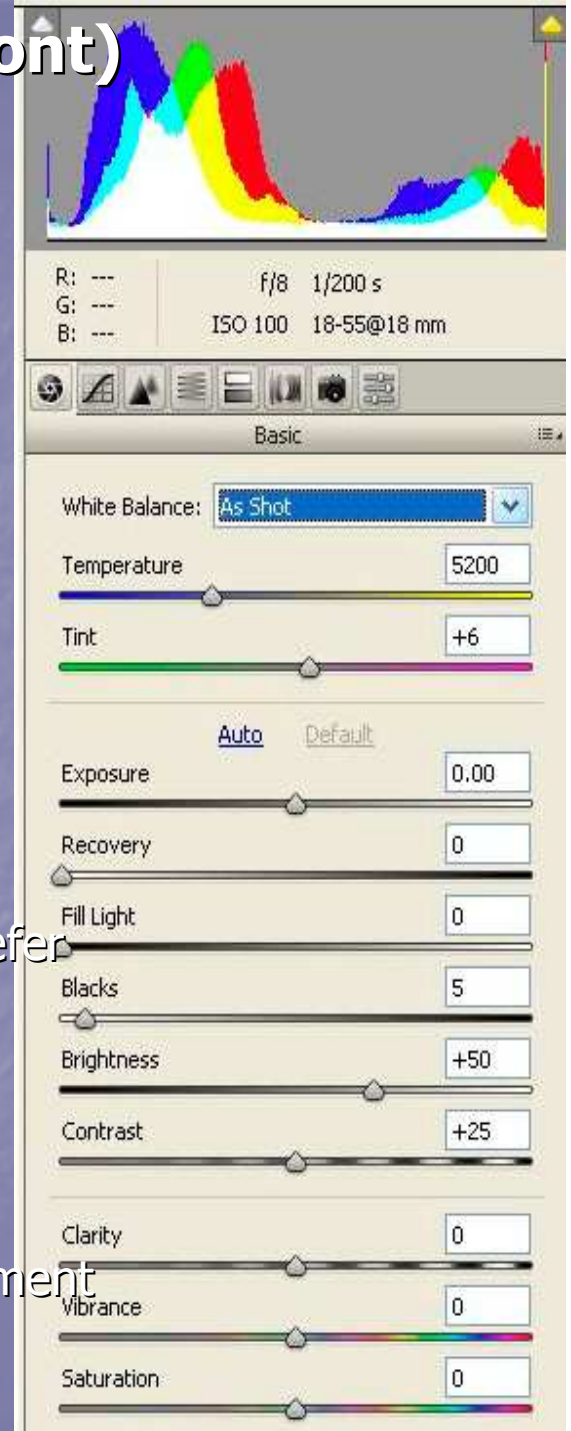

# How do you process camera raw files? (cont)

## *Basic Panel*

### Tone adjustment sliders

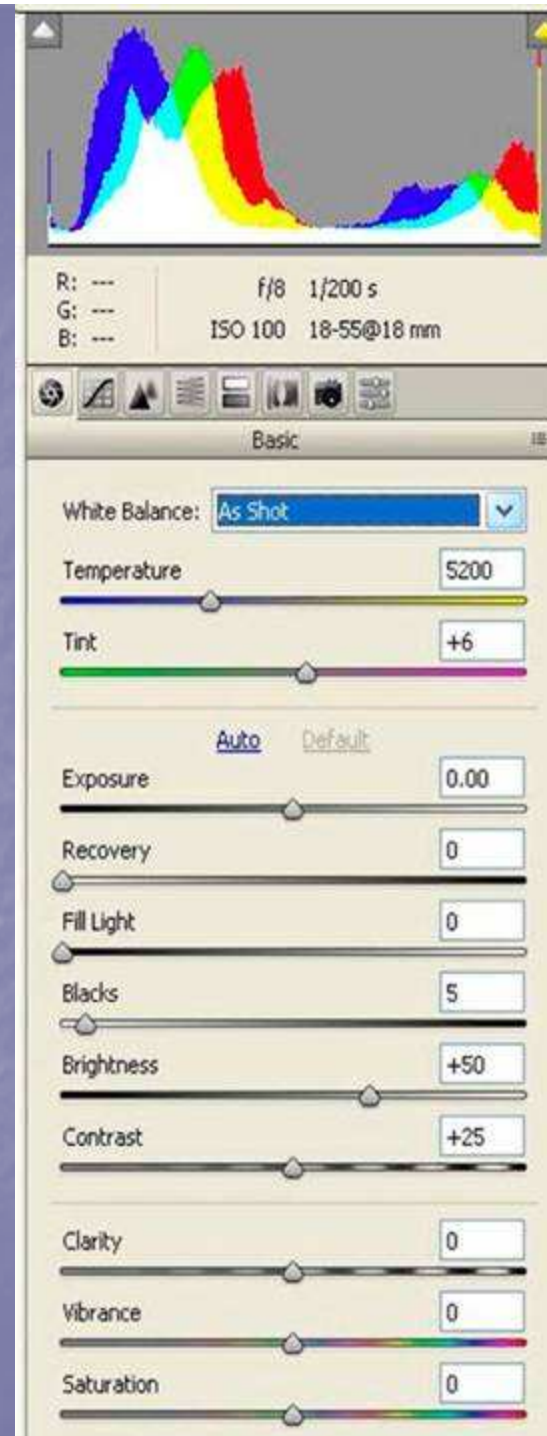

- Exposure  
Mainly a white clipping adjustment, large increases in exposure value (more than 0.75 of a stop) will increase shadow noise and posterization
- Recovery  
Highlight Recovery works in conjunction with Exposure
- Fill light  
Brings out detail in shadows and doesn't effect rest of image
- Blacks (shadow clipping)  
A Black clipping control (default is 5 but in general I prefer 3 or less)
- Brightness  
Redistributes the midtone values
- Contrast  
Different than Photoshop Contrast, uses S curve adjustment

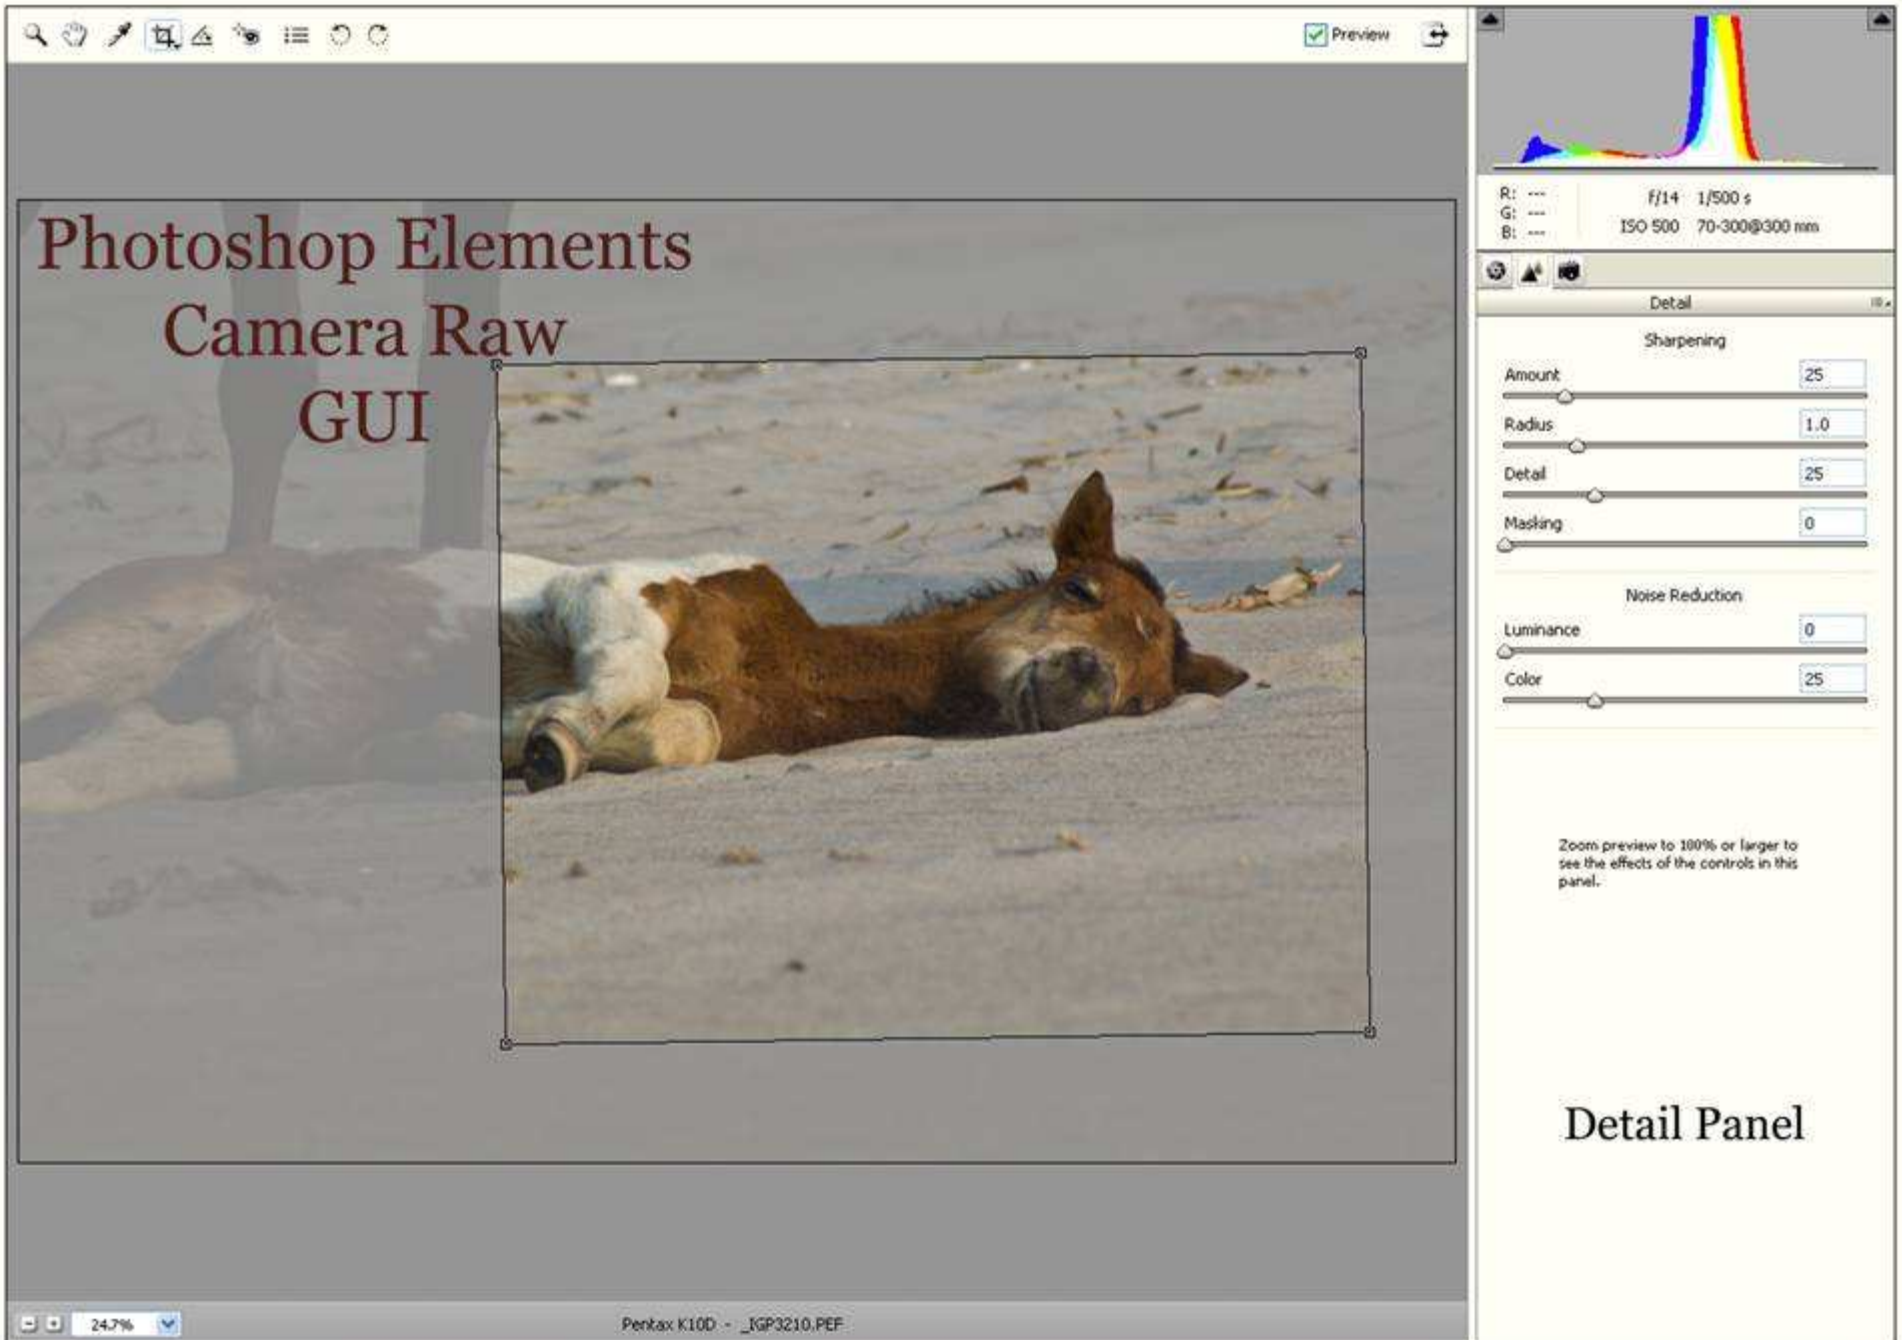

## How do you process camera raw files? (cont) *Basic Panel*

### Presence Values (from Lightroom)

- Clarity  
Is like a lens cleaning filter and works like Unsharp Mask in Photoshop. I use it on just about every image
- Vibrance  
Is like saturation only works more on unsaturated colors
- Saturation  
Is gentler version with finer controls than Hue/Saturation

Zoom preview to 100% or larger to see the effects of the controls in this panel.

## Detail Panel

# How do you process camera raw files? (cont) *Details Panel*

- Sharpening Controls (zoom to 100% & use preview, halos should be invisible at this Zoom)
  - **Amount** 0 to 150
  - **Radius** 0.5 to 3 pixels (defines either side of an "edge" the sharpening will be applied) above 1 one has a tendency to make the photo look phony/over sharpened
  - **Detail** 0 to 100, depends on how blurred and texture dependent
  - **Masking** reduces sharpening in nonedge areas while concentrating on edges, 0 implies sharpening is applied to everything in image equally i.e. no mask
- Noise Reduction Controls (zoom to 200%) Noise is usually caused by high ISO or underexposure)
  - Luminance Noise
  - Color Noise

# Toolbar

- Redeye Removal (E)
- Open Preference Dialog (Control K)
- Rotate Buttons (L) (R)

# READING WHITE BALANCE FROM A HISTOGRAM

- You use the color histogram in ACR to do this.
- When you shoot a flat card you'll see a spike in each color channel's histogram.
- You're balanced (neutral) if the spike happens in the same place in each channel. If not, you're not balanced. This is easy: if the red channel is too far to the right (too light) you have too much red. You get the picture.
- You don't even need a card. Look at your histograms. If all 3 stop at the same point then your highlights are neutral. If not, your highlights aren't neutral. Obviously if you have sky you'll see the blue channel further off to the right.

# How do you fix White Balance in the Raw processing in this case?

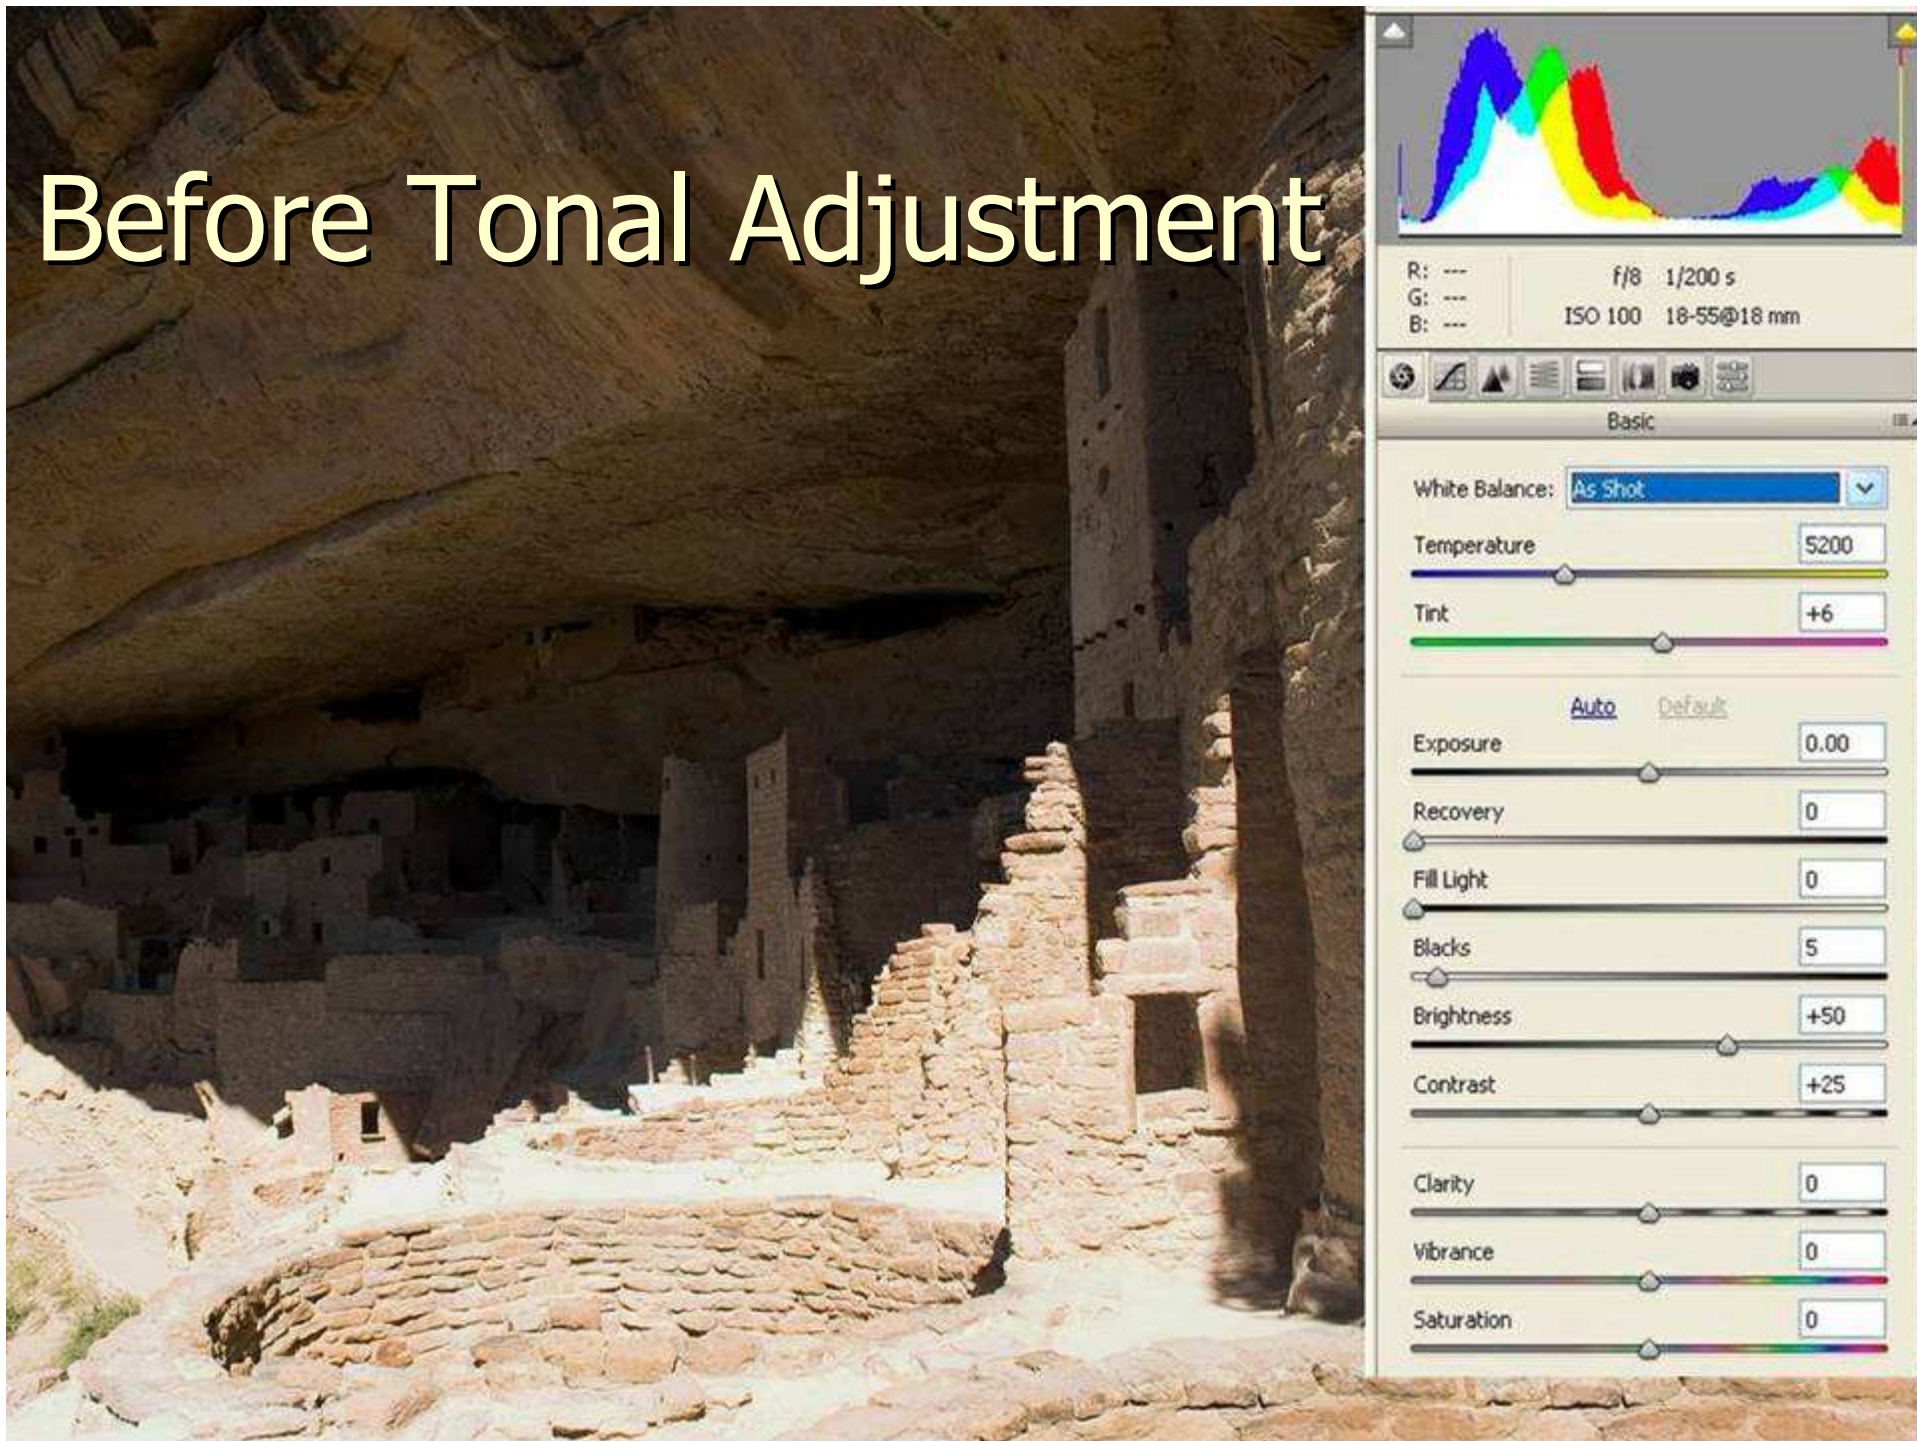

The only Change is from **As Shot** to **Flash**

The screenshot displays the Adobe Lightroom Raw processing interface. The central area shows a photograph of a small, furry animal, possibly a mouse or hamster, with a white balance adjustment overlay. The right-hand panel, titled 'Basic', contains various adjustment sliders and dropdown menus. The 'White Balance' dropdown menu is set to 'Flash', and the 'Temperature' slider is set to 5500. Other sliders include 'Tint' (0), 'Exposure' (0.00), 'Recovery' (0), 'Fill Light' (0), 'Blacks' (5), 'Brightness' (+50), 'Contrast' (+25), 'Clarity' (0), 'Vibrance' (0), and 'Saturation' (0). The top right corner of the interface shows camera metadata: 'R: --- f/5.6 1/180 s', 'G: --- ISO 100 70-300@300 mm', and 'B: ---'. The bottom of the interface includes a 'Save Image...' button, a file path 'Pentax K10D - \_IGP2220.PEF', and a color profile 'sRGB IEC61966-2.1; 16 bit; 3872 by 2592 (10.0MP); 300 ppi'. At the bottom right, there are 'Open Image', 'Cancel', and 'Done' buttons.

# Multiple Image Raw Processing

The screenshot displays the Adobe Camera Raw interface for processing multiple raw images. The main workspace shows a photograph of a white egret standing in a pond, with its reflection visible in the water. The left sidebar contains a grid of image thumbnails, with the selected image highlighted. The right sidebar shows the adjustment panel with various sliders and controls. The bottom status bar indicates the camera model and the number of selected images.

Adjustment Panel Settings:

- White Balance: Custom
- Temperature: 2650

- Clarity: 78
- Vibrance: +36
- Saturation: +23

Status Bar: Pentax K10D - \_JGP6495.PEF 7 selected/7

# Save Raw Editing

- Done (Makes changes Sidecar file to remember changes, no picture file is created)
- Cancel (does nothing)
- Save Image (DNG Only choice in Elements).. In Photoshop (DNG, Tiff, Jpeg, Psd)
- Open Image (Will open image in Photoshop elements or CS3 or 4 for editing/saving or just saving)

## When saving the image why 16 bits and the high bit advantage?

- Any cameras that shoot Raw capture at least 10 bits/pixel up to 1024 tonal values
- Most cameras capture 12 bits or 4096 levels
- An 8 bit/pixel image (a jpeg) only allows 256 tonal values in each channel throwing away a great deal of potentially useful data
- The main advantage of 16 bit images is they offer massively more editing head room
- Downside of 16 bit images
  - Twice the storage space on disc or memory
  - Some editing features won't work (although this is improving with newer editions of Photoshop)

# Raw Topics/Panels in CS3 & 4, and Lightroom and not covered in this workshop, but should be considered for further investigation

- Tone Curve (no curves at all in Elements)
- HSL/Grayscale (precise and selective hue/sat non-primary adjustments plus Grayscale controls)
- Split Toning (one tint in highlights and one for shadows)
- Lens Correction (chromatic aberration red/cyan and blue/yellow, plus vignetting)
- Camera Calibration (fine tuning of Adobe's profiles for your cameras)

# Raw Downside

- Processing time and inconvenience
- File Size (2 to 4 times Larger)
- Longevity
  - Just about every camera has a proprietary format
  - Will someone be able to read Raw files in 10 years, 100 years?
  - Adobe DNG may be the answer

# Some things to Try

- Shoot Raw and try your camera's proprietary software
- Try ACR and adjust the controls to see if you can improve the photos
